Acne Scar Approval Is Next Focus

A 10-minute, 1.5-Hz, 150-mJ treatment was completed in a single session. This type of treatment is typically associated with minimal downtime and minimal risk of post-inflammatory hyperpigmentation. The patient was satisfied with the results and returned for a follow-up appointment in 6 weeks. The final photographs were taken at this appointment, and the patient's skin was assessed for any residual signs of acne scarring. The results showed a significant improvement in skin texture and a reduction in the appearance of acne scars.
